

The Possibility of Speed Faster Than the Speed of Light in Several Ways

Gh. Saleh

Saleh Research Centre, Netherlands

When Einstein expresses his theory of relativity, this was his important point that there was an ultimate cosmic speed limit, and that only massless particles could ever reach it. But scientists have always looking for particles that move faster than light, because prove of the existence of speed faster than light will cause a great changes in the future of physical science. In this paper, we are going to explain 10 great and logical reasons for the possibility of speeds faster than of light. We have been used Hubble's law, Blueshift (Redshift), data from Hubble Space Telescope, etc. to prove that.
