

Calculation of Gravitational Waves Frequency and Its Nature, Structure and Application

Gh. Saleh

Saleh Research Centre, Netherlands

Since based on Saleh Theory the photon is the basis of the universe and every structure is made up of photons, the nature of gravitational waves also is the photon. And its structure is based on the motion of photons. In the gravitational waves, photons are separated from the stars Because of the effect of the planets, so that their external motion is intertwined in their internal motion or its superstring state, and form the long continuous series of photons. In fact, it can be said that in the solar plasma environment, the external motion of a photon converges with its internal motion and it leads to converging photons and forms a single superstring structure that is interconnected in a ring to ring feature and travels between the star and the planet.

In this paper, by using this structure, we will calculate the frequency of gravitational waves. The applications that can be achieved by using this structure and frequency are data transmission, tens, hundreds, thousands, ... of times of the light speed in the universe, creating a speed close to the speed of light in spacecraft, creating artificial gravity in spacecraft, creating a gravity power using gravitational turbines, etc.
