

Proving the Source of Gravity Using the Big Bang Phenomenon and Magnetic Phenomena

Gh. Saleh

Saleh Research Centre, Amsterdam, Netherlands

If we consider the phenomenon of Big Bang as the primary source of the Universe, which is the creator of all space and time, all kinds of forces and energies, in fact, the source of all these points is the existing mass of the Big Bang, with its one and complex nature. In fact, we can say the mother of all objects (stars, planets, black holes, etc.) is the phenomenon of the Big Bang. The mother of all forces is also the Big Bang. The model change of the state of the particles of the Big Bang creates energy and forces, and naturally, a force such as gravity can be related. We knew about the initial mass of the Big Bang. In fact, the initial mass of the Big Bang is the mother of everything we see, and the force like gravity is part of its components, which holds objects such as stars and black holes together, and we do not have anything called ether.
